

Migratory caribou activity (*Rangifer tarandus*) in the vicinity of the hydroelectric reservoirs of La Grande Complex, James Bay, Subarctic Quebec, Canada

Mélyssa Vachon

*Master student
Biology Department
Université Laval, Québec
Canada*

Stéphane Boudreau

*Professor
Biology Department
Université Laval, Québec
Canada*

Presentation at the 4th PPS Arctic Meeting, Zvenigorod, Russia, April 2009

Migratory species

Overhunting & poaching

American bison¹
(North America)

Mongolian gazelle
(China & Mongolia)

Saïga antiloppe
(Kazakhstan & Russia)

Migratory species

Overhunting & poaching

American bison
(North America)

Mongolian gazelle
(China & Mongolia)

Saïga antiloppe
(Kazakhstan & Russia)

Anthropogenic barriers

Mongolian gazelle
(railroads, Mongolia)

Tibetan antelope
(human disturbance)

Migratory species

Overhunting & poaching

American bison
(North America)

Mongolian gazelle
(China & Mongolia)

Saïga antiloppe
(Kazakhstan & Russia)

Anthropogenic barriers

Mongolian gazelle
(railroads, Mongolia)

Tibetan antelope
(human disturbance)

Habitat loss

Wildebeest
(agriculture, Kenya)

African elephant
(agriculture, Tanzania)

Hartebeest sp.
(agriculture, Tanzania)

Oryx
(agriculture, Tanzania)

Caribou & Industrial Development

✓ **Population:**

4 800 000 animals / 24 herds ($\frac{1}{2}$ >100 000) Polar circle

✓ **Fluctuations:**

- Decline 1950
- Growth 1970 +

✓ **Oil & Hydroelectricity Development (1970)**

✓ **Occupy the Arctic since > 2 M years**

✓ **Short & long term consequences**

✓ **Research project in Alaska & Norway**

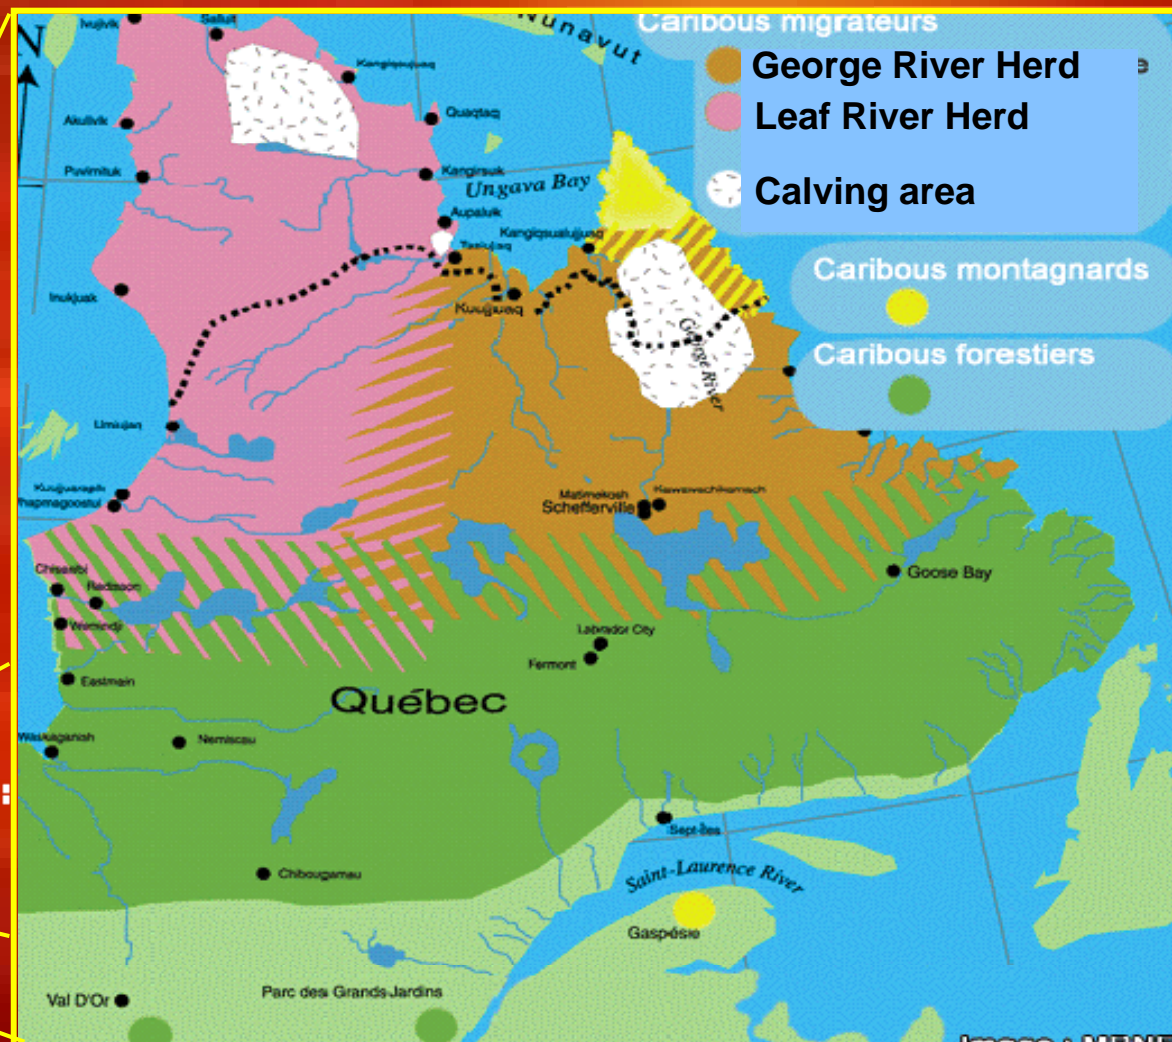

Herds of Northern Quebec

✓ George River Herd

✓ Leaf River Herd

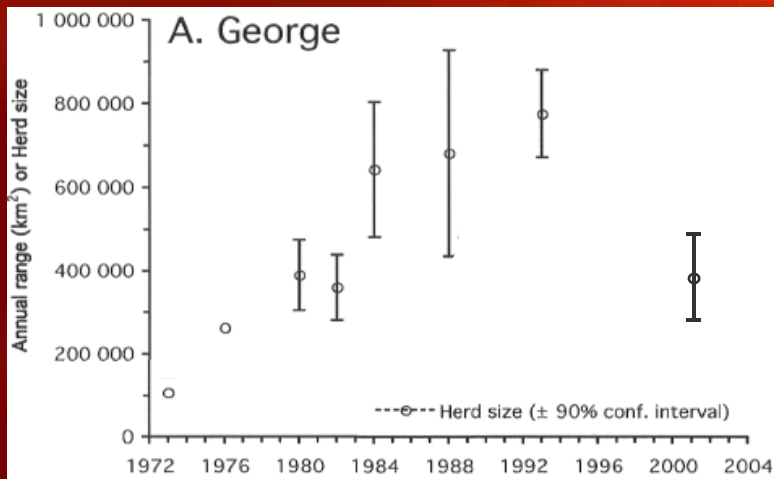

George-River Herd

GRH

✓ Demography

- ↑ End XIXe
- 1950: very low
- 1988: 682 100 ± 36%
- 1993: 775 891 ± 13,4%
- 2001: 385 000 ± 28%

(Couturier *et al.* 2007)

George-River Herd

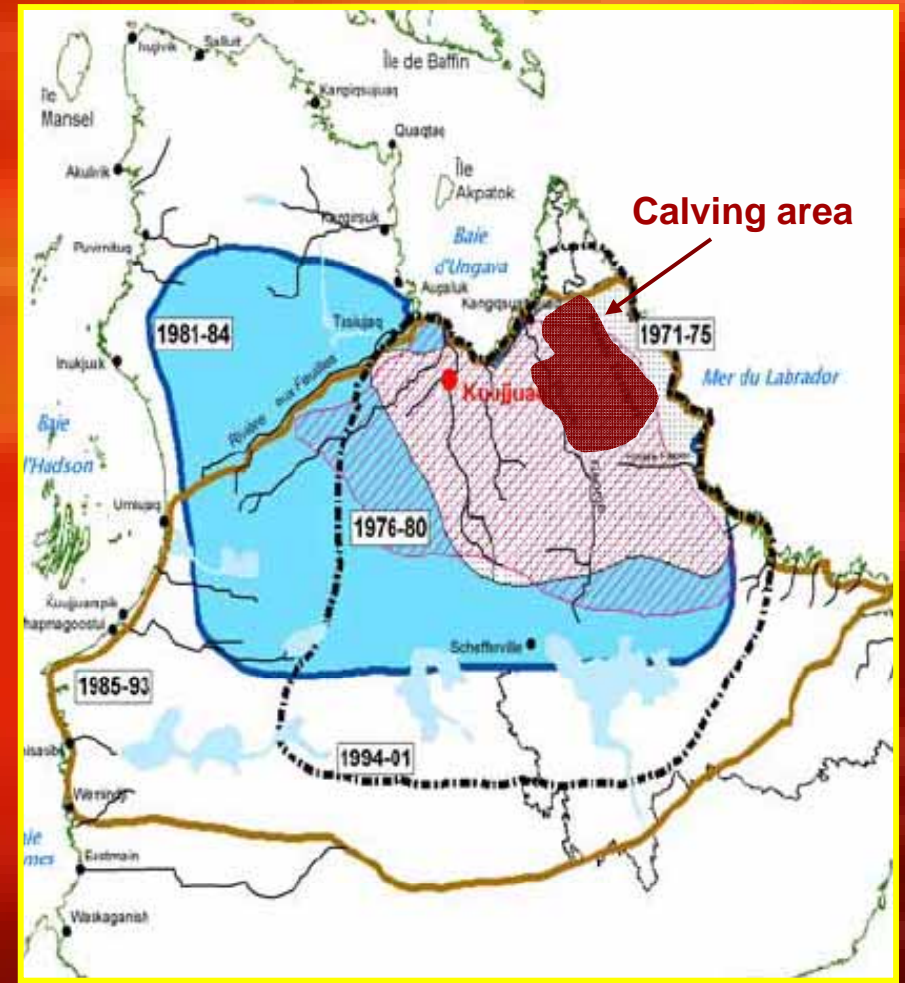

GRH

✓ Demography

- ↑ End XIXe
- 1950: very low
- 1988: 682 100 ± 36%
- 1993: 775 891 ± 13,4%
- 2001: 385 000 ± 28%

✓ Range

- 160 000 km² 1971-75
- 606 000 km² 1989
- 257 000 km² 2002

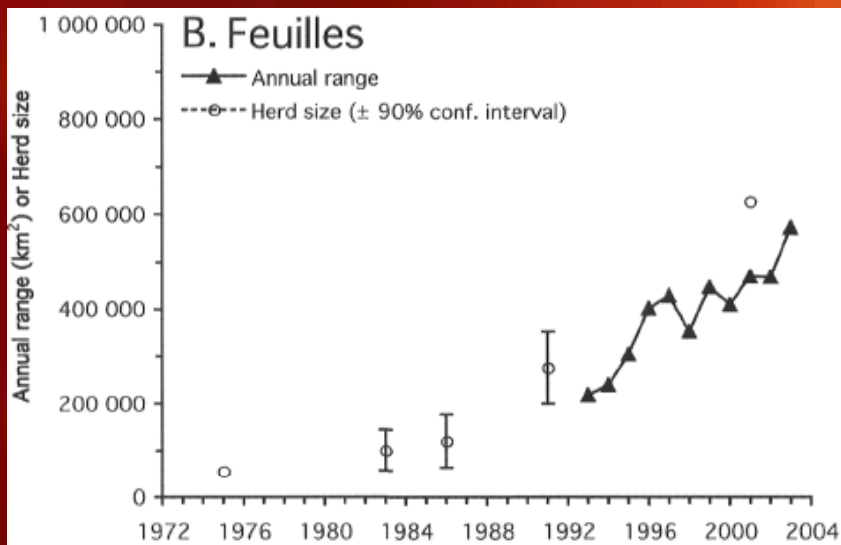

Leaf River Herd

LRH

✓ Demography

- 1975: 56 000 animals
- 1991: 276 000 ($\pm 27,5\%$)
- 2001: 628 000

(Couturier *et al.* 2007)

Leaf River Herd

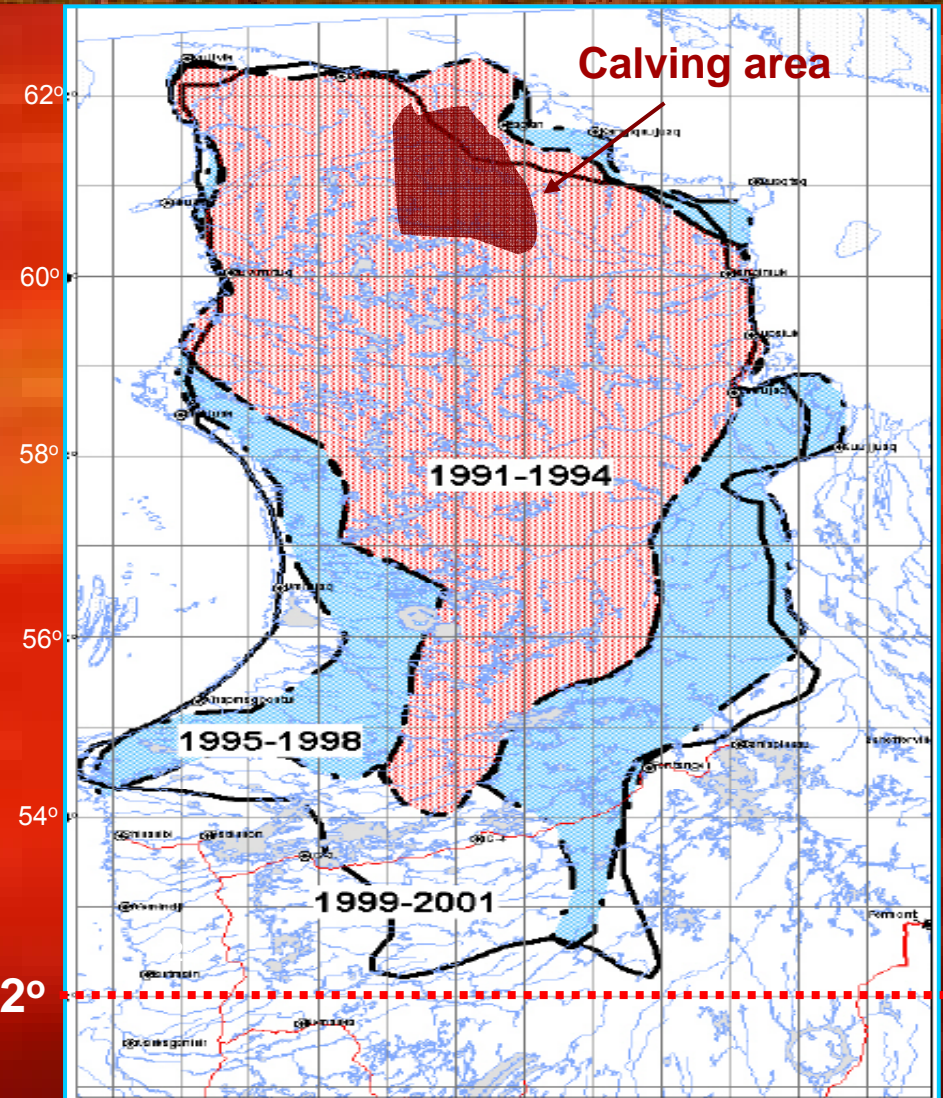

LRH

✓ Demography

- 1975: 56 000 animals
- 1991: 276 000 ($\pm 27,5\%$)
- 2001: 628 000

✓ Range

- 218 000 km² 1993
- 573 000 km² 2003

La Grande Complex

Hydroelectric Development

- ✓ James Bay, Northern Quebec
- ✓ 8 generating stations along the La Grande river
- ✓ 800 km, 54th parallel, Caniapiscau to James Bay
- ✓ Southern boundaries of the GRH & LRH range

Objectives

General

- ✓ *General description of caribou activity in the vicinity of the La Grande Complex revealed by tree-ring data*

Specifics

- ✓ *Activity pattern before, during and after the LG4 and Caniapiscau flooding*
- ✓ *Verify if the island are used as rest areas*

Study area

Area

- ✓ 53° 45' S & 54° 58', GRH & LRH
- ✓ East part of the La Grande Complex
- ✓ LG4 to Caniapiscau reservoirs

✓ Taiga

- ✓ Spruce-lichen woodland
- ✓ Spruce-moss forest
- ✓ Peatland

Methods

Trampling scars

- ✓ *Impact of caribou hooves on conifer roots*
- ✓ *Scars can be dated because radial growth stop at the lesion*
- ✓ *Change in scar frequency = change in caribou activity*
- ✓ *250 scars/site*
(Morneau et Payette, 1998)

Sampling & Analyse

Sampling sites & scars

✓ Land & Air

- Roads TT, LG4, LA1, LA2
- Transects 25-35 km

✓ Sampling scars

- Summer 2007-08
- 300 roots cross-section (250 scars)

Samplage & Analyse

Samplage sites/scars

✓ Land & Air

- Roads TT, LG4, LA1, LA2
- Transects 25-35 km

✓ Sampling scars

- Summer 2007-08
- 300 roots cross-section (250 scars)

Caribou activity index

- ✓ Build an age-frequency distributions of trampling scars for each site
- ✓ Apply a log-linear regression to remove an exponential trend from the age structure of scars
- ✓ Use the residual values of the regression as an indicator of the activity
- ✓ Cluster analyse using Pearson's correlation coefficient

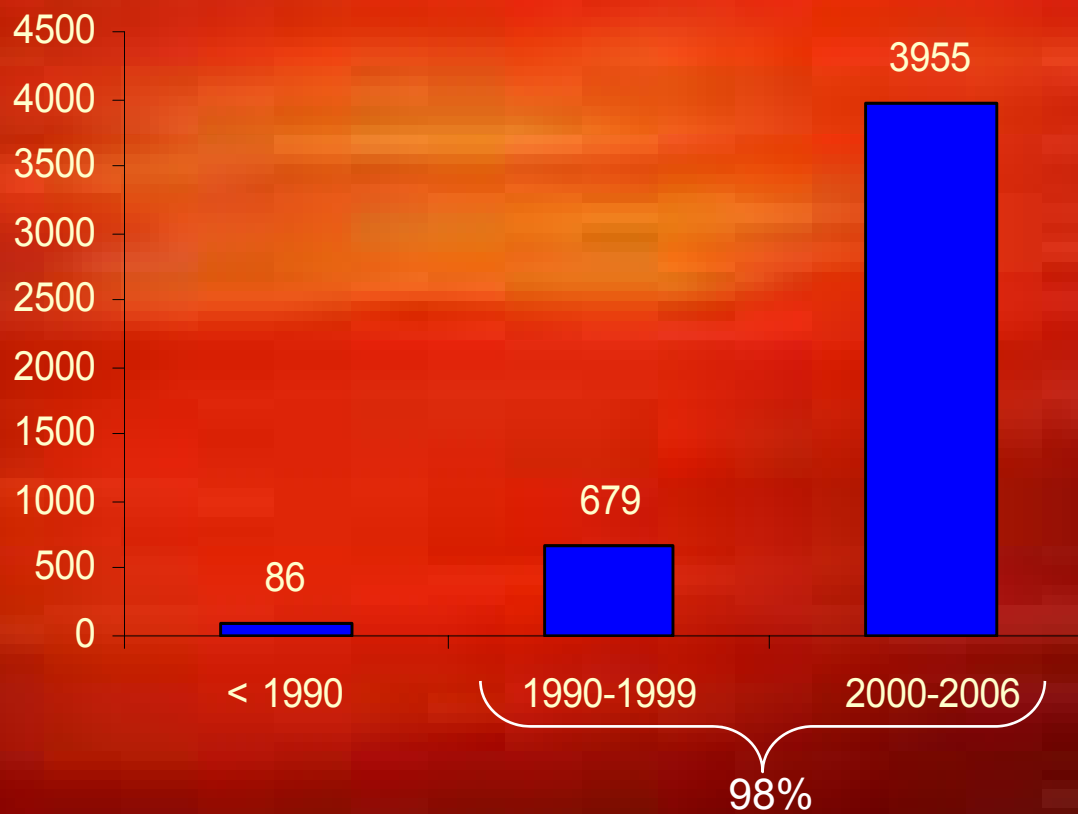

La Grande 4

Scars distribution

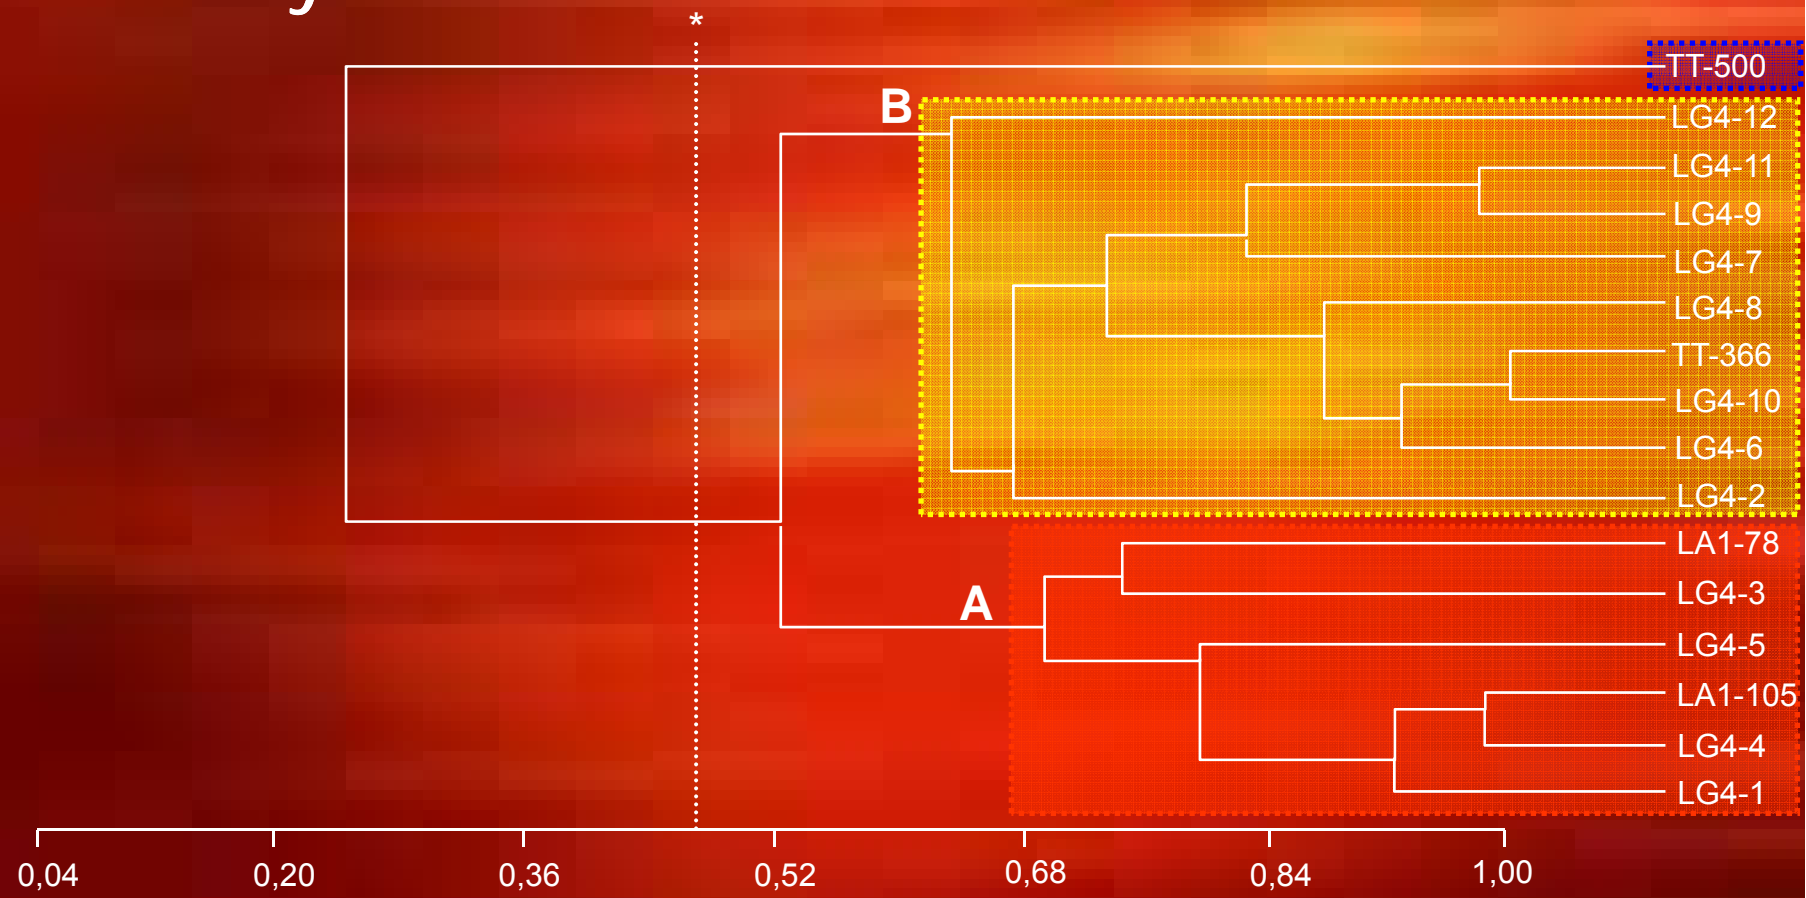

✓ *Scars used:*

- 23 sites
- 4720 total
- 4634 (1990-2006)
- 16/23 sites > 100 scars

La Grande 4

Cluster analysis

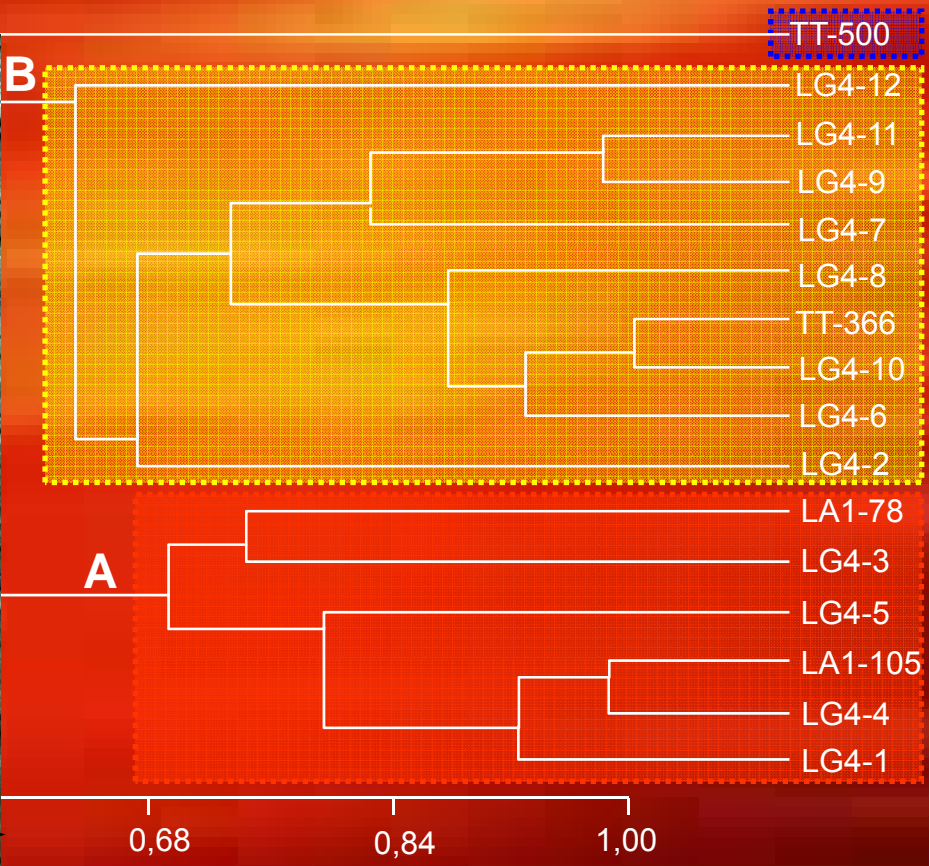

* Pearson coefficient threshold: 0,497

La Grande 4

Cluster analysis

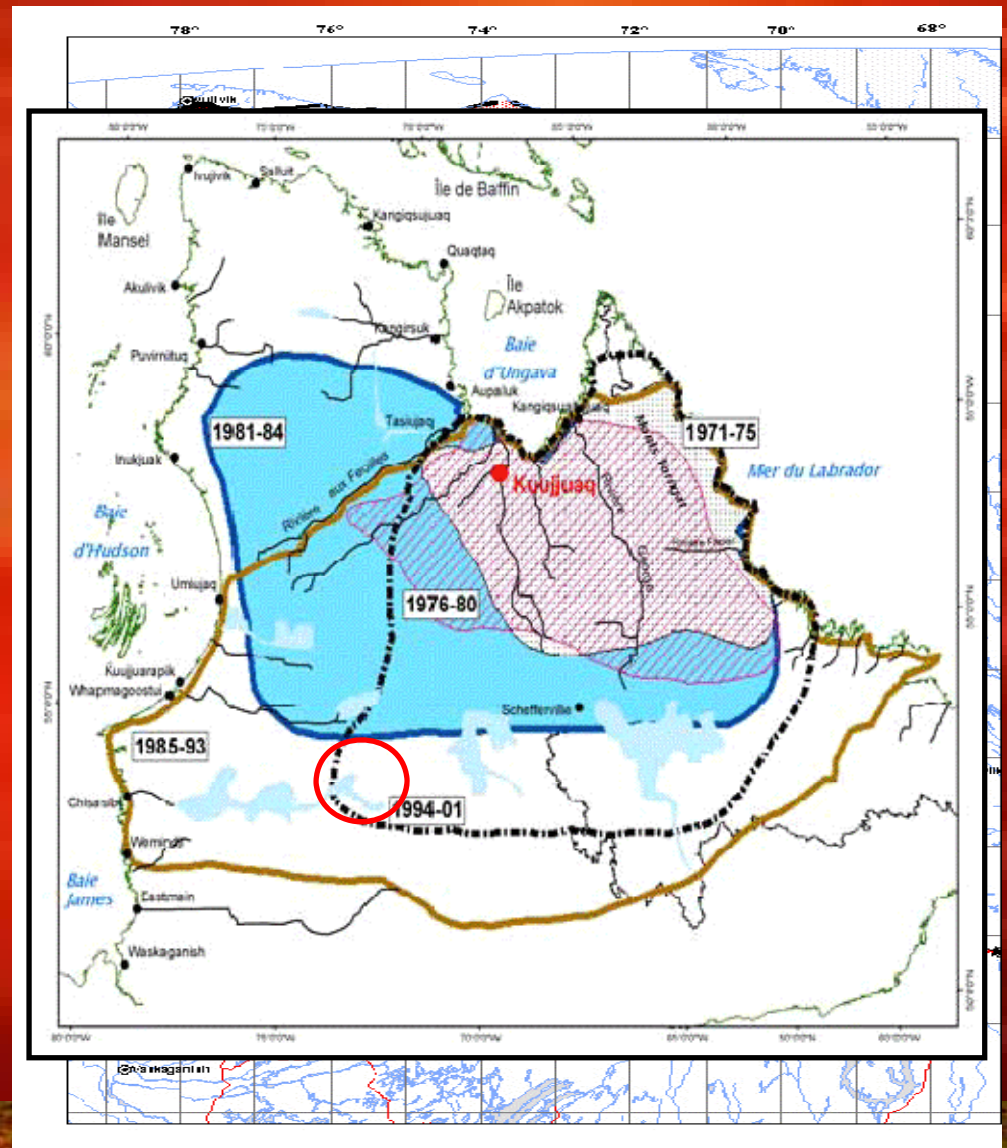

*
⋮

La Grande 4

Range, Census & Activity

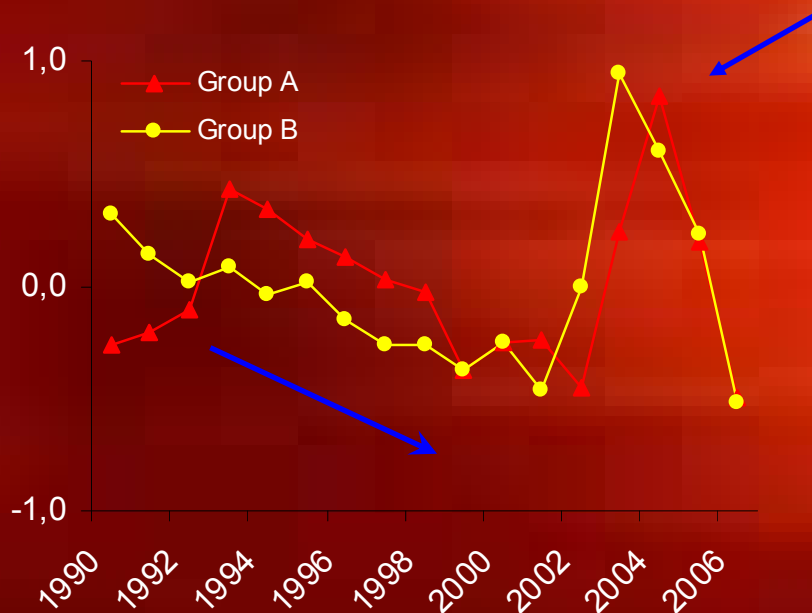

- ✓ *Reservoir 1984-86, no direct effects*
- ✓ *Range*
 - GRH 1985
 - LRH 1999

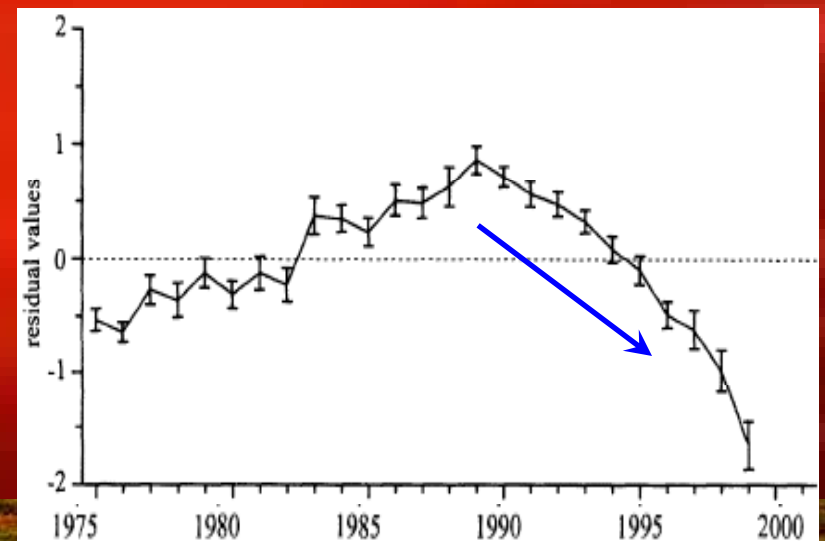

La Grande 4

Range, Census & Activity

- ✓ Reservoir 1984-86, no direct effects
- ✓ Range
 - GRH 1985
 - LRH 1999
 - activity curve = GRH demographic trend

Couturier, 2007

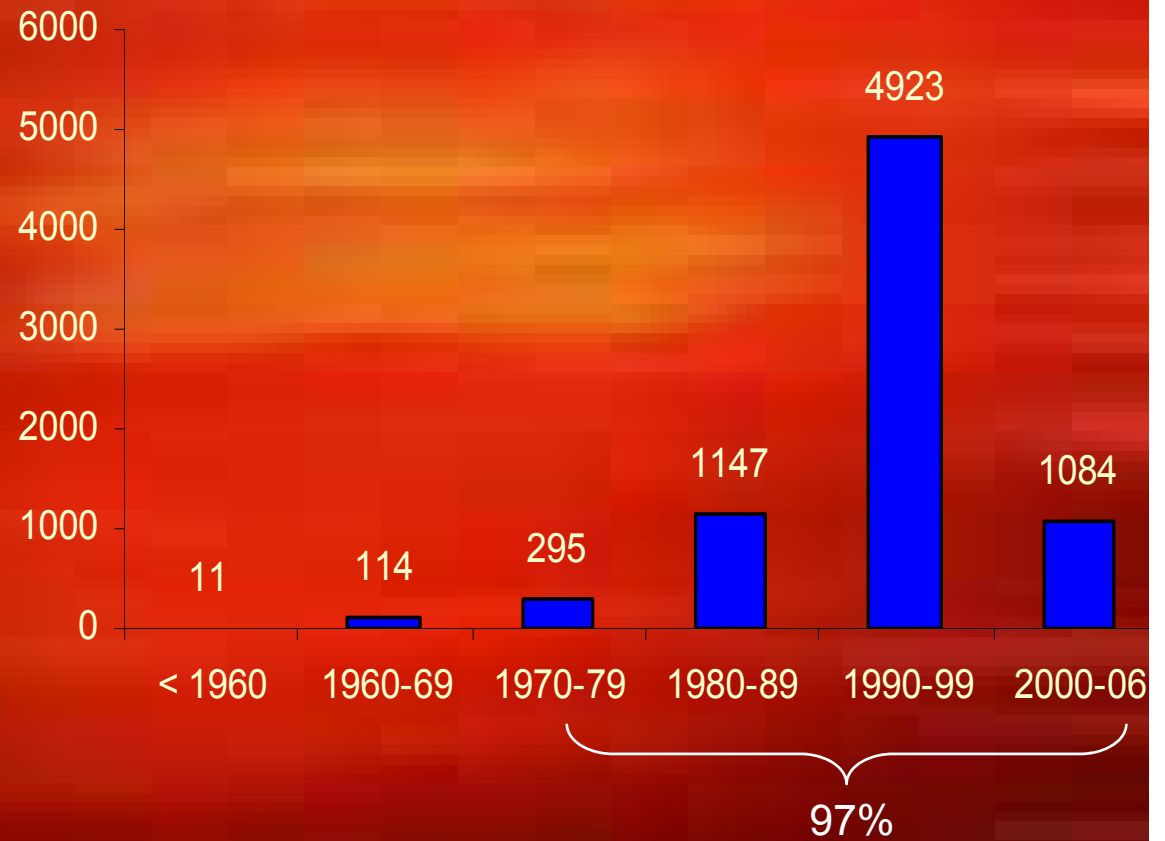

Boudreau et al. 2003

Caniapiscau

Scars distribution

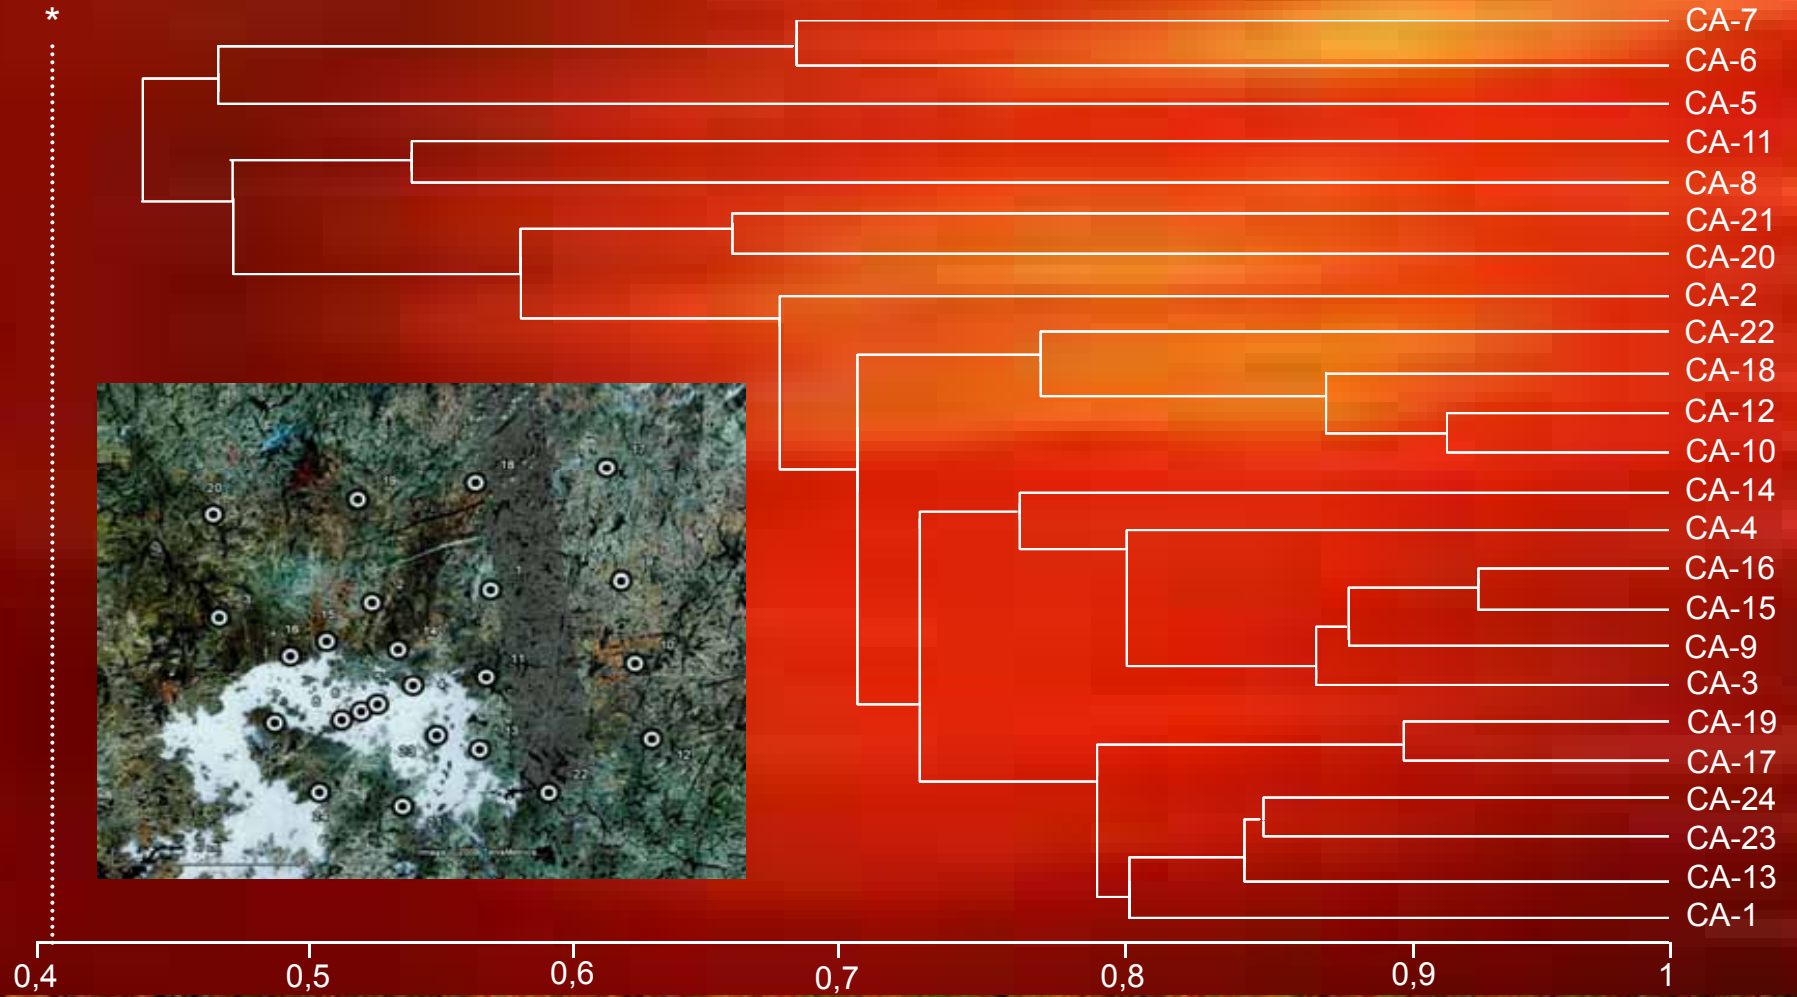

✓ Scars used:

- 7638 total
- 24 sites 295 scars/sites
- Scarce before 1975
- **7319 (1975-2006)**

Caniapiscau

Cluster analyse

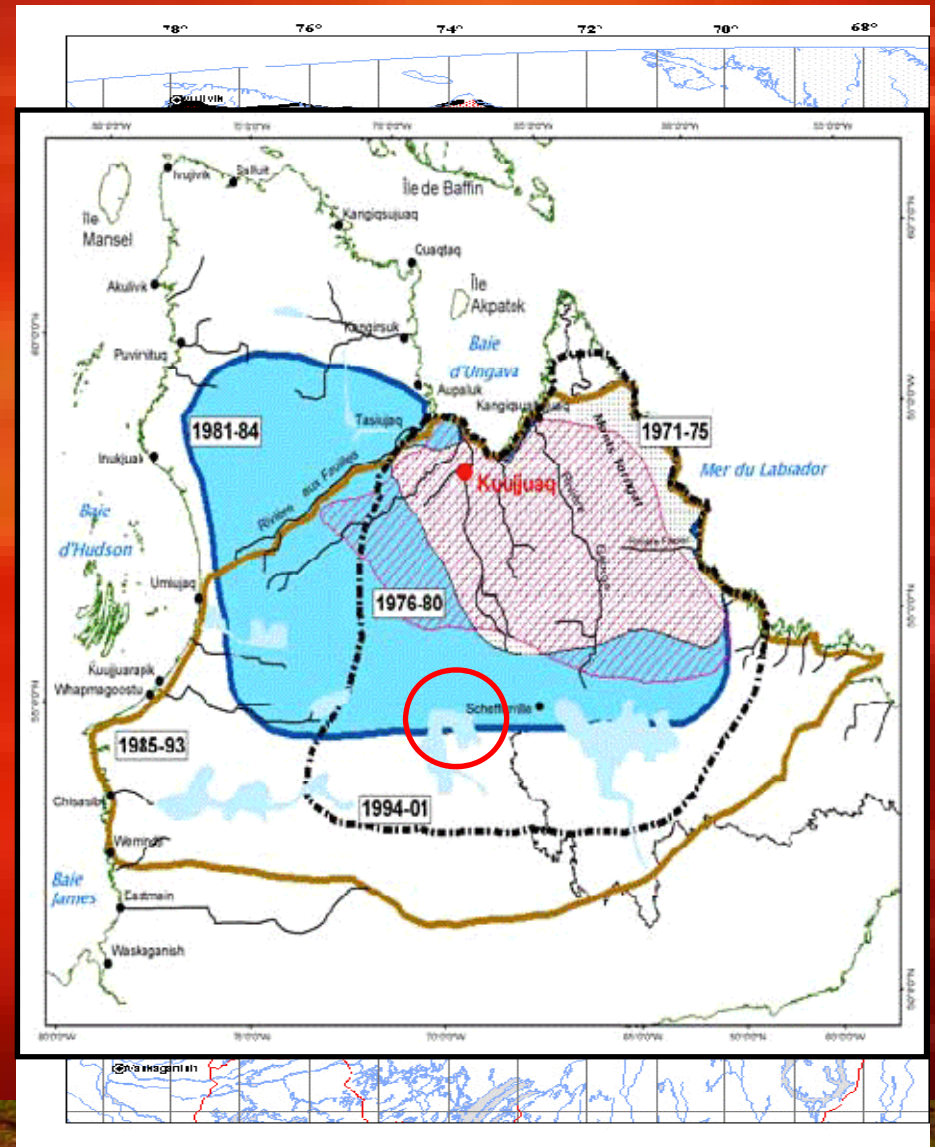

* Pearson coefficient threshold: 0,404

Caniapiscau

Range, Census & Activity

- ✓ *Index for 1975-2006*
- ✓ *Reservoir 1982-84*
- ✓ *Range*
 - GRH 1981
 - LRH 2001

Caniapiscau

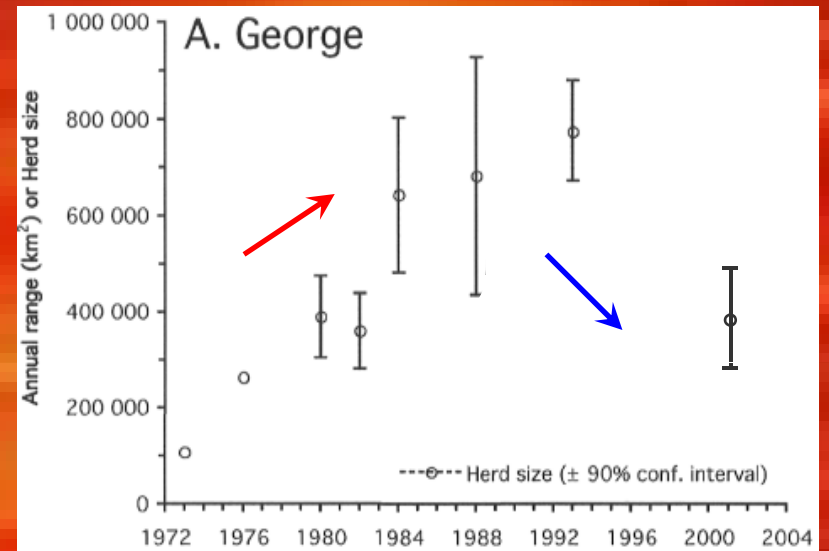

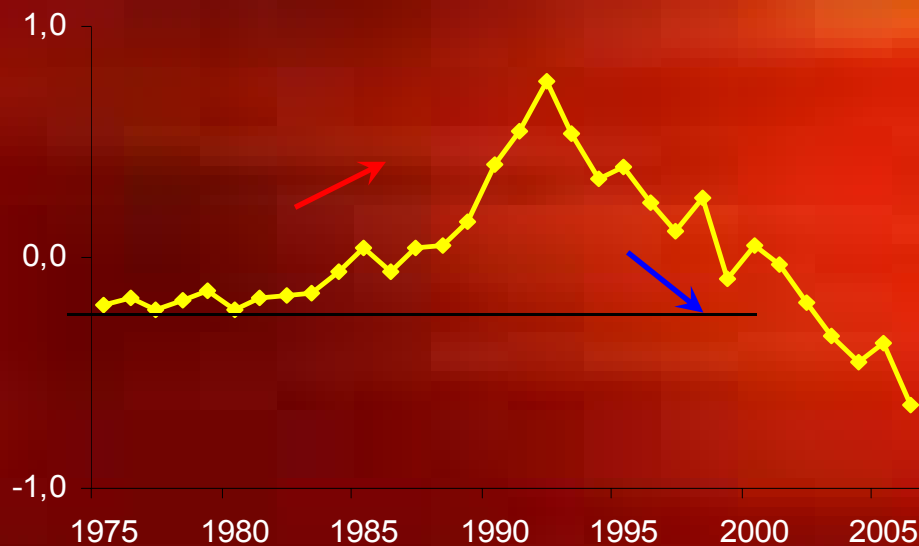

Range, Census & Activity

✓ Index for 1975-2006

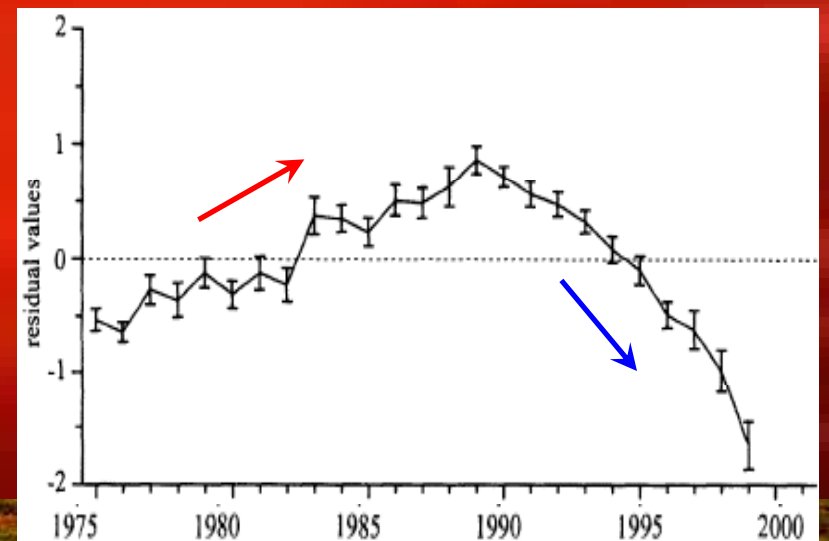

✓ Reservoir 1982-84

✓ Range

- GRH 1985
- LRH 1999
- activity curve = GRH demographic trend

Couturier, 2007

Boudreau et al. 2003

Caniapiscau

Range, Census & Activity

✓ Index for 1975-2006

✓ Reservoir 1982-84

✓ Range

- GRH 1985
- LRH 1999
- activity curve = GRH demographic trend

Couturier, 2007

Boudreau et al. 2003

Caniapiscau

Trend in caribou activity reflect 2 potential phenomena

✓ *Fluctuation of population size*

✓ *Change in geographical distribution*

- Increase or decrease of activity \neq change in population size
- Boudreau *et al.* study vs this study
- Might explain the delay in 1990
- Fall & Spring range are more important than summer range
- Interannual variability of used area
- Compare with telemetry location

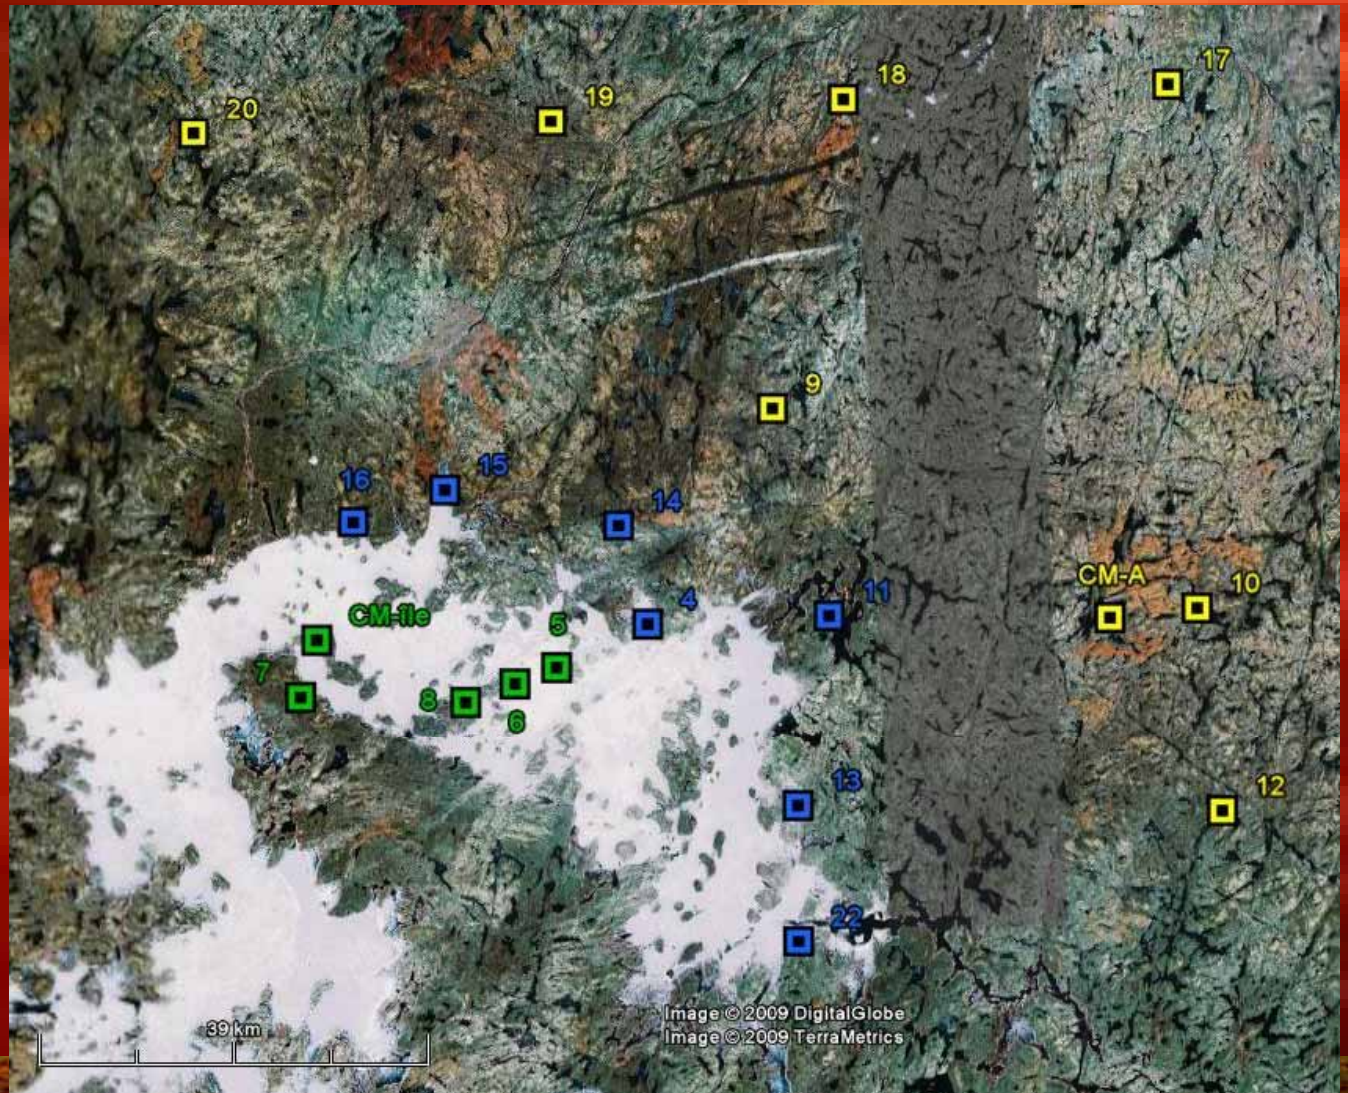

Islands vs Land

Sites Localisation

- ✓ *Island*
- ✓ *Perimeter*
- ✓ *Inland sites*

Islands vs Land

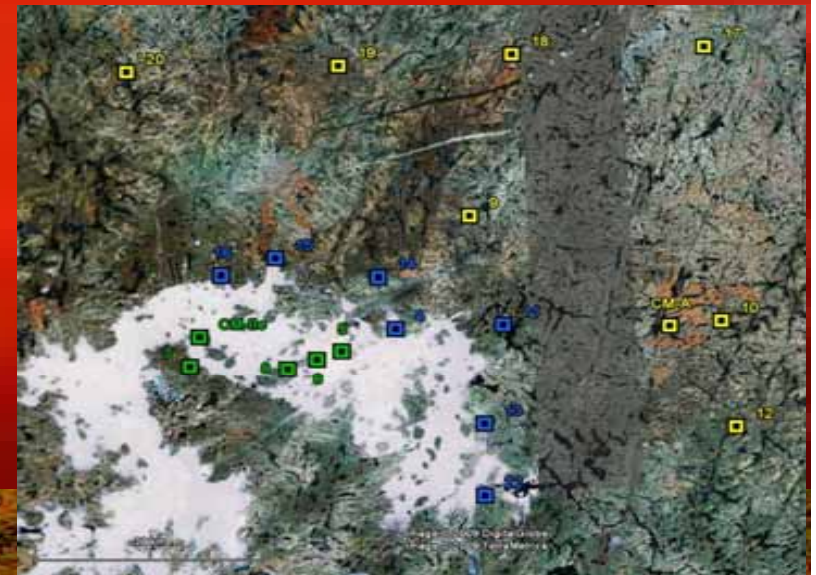

Curve of activity on Island, Perimeter & Far Sites

✓ *During (> island)*

- Gradual arrival of GRH from North & North-East (from summer habitat)
- lichen woodland good source of food
- New feeding zone
- High concentration on a small superficicy

✓ *After (island stable, land ↑)*

- habituation waiting for ice cover to cross
- if true, less scars on island because of snow cover

Conclusion

- ✓ *Describe caribou activity for the last decade*
- ✓ *Recent presence in LG4 region*
- ✓ *Earlier presence in Caniapiscou region*
- ✓ *Activity index related to fluctuations of population size & geographic distribution*
- ✓ *Flooding influence, but habituation*
- ✓ *Compare telemetry locations & photo census to get a complete portray*

Caribou & Industrial Development

1.2 Introduction

Oilfield Prudhoe Bay, Alaska

- ✓ **CACH territory june & july**
- ✓ **Divided opinion on effect**
- ✓ **Effets sur les individus**

- Abondance parturientes avec développement^{22,23,24,25,26}, plus sensibles que ^{27,28}
- Évitent la bordure des routes (< 2km) et 3 x + nombreuses à > 4km²²
- Combinaison routes et pipelines > déplacements^{29,30} > dépenses énergétiques³⁰
- Abondants sur champ pétrolier et distribution indépendante des installations³¹
- Effets temporaires, densité en bordure de la route, 10 ans plus tard, rétablie²⁶
- Adaptation ou distribution naturelle²⁶

Champ pétrolifère de la Baie Prudhoe

✓ Effets sur le troupeau

- Productivité du troupeau atténué^{23,32}
- Impacts potentiels (anthropiques vs environnementaux)^{27,33}
- 6000 têtes en 1978 à 27 000 en 2000²³
- TAC vs 3 autres troupeaux du Nord de l'Alaska³³
 - taux de croissance
 - ratio faon/femelle
 - densité
- Facteurs naturels (*densité, la prédation, les parasites, la condition de l'habitat*) vs facteurs anthropiques = difficilement différenciables

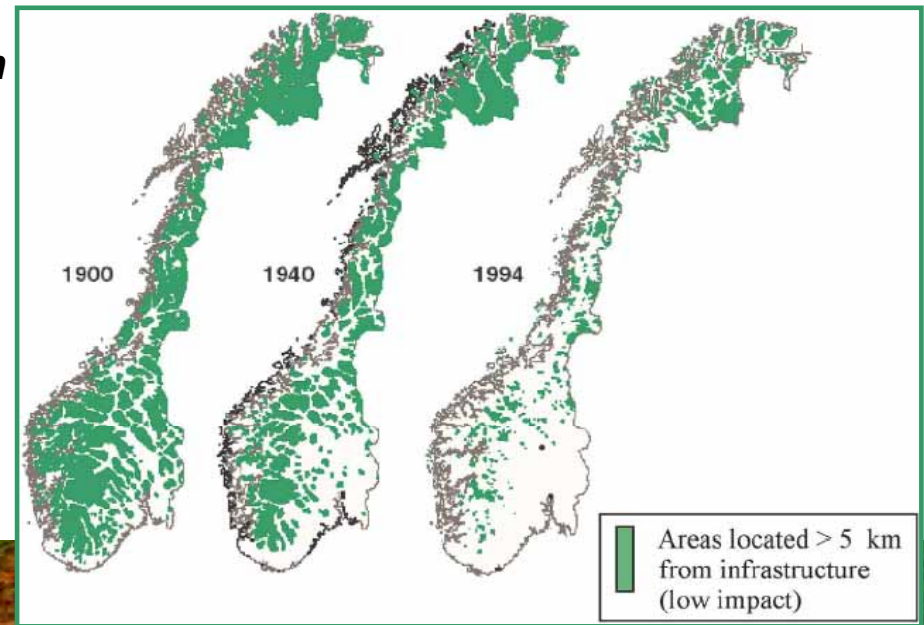

Caribou et développement industriel

1.2 Mise en contexte

Développement hydroélectrique en Norvège

- ✓ *Pays nordique ayant subi le plus haut taux de développement d'infrastructures³⁴*
- ✓ *26 sous-populations*
- ✓ *des constructions = densité*
- ✓ *Évitement des infrastructures = compétition pour la nourriture*
- ✓ *plus sensible que*
- ✓ *Impacts plus importants lorsque combinaison des perturbations*
- ✓ *Entrave aux routes de migrations par installations et inondations*
- ✓ *Perte d'habitat d'été*

Methods

3.0 Methods

Tree-ring analysis

✓ *Animal population dynamic*

- Beaver
- Voles & porcupine
- Moose
- Snowshoe hare

Trampling scars

✓ *Past caribou activity*

Tree-ring analyse

✓ *Trampling scars*

- Impact of caribou hooves stop radial growth at the lesion
- Conifer roots are easily damaged by caribou trampling
- Capacity to produce scars is maintained over the years

- Superposed scars

- Minimum of 250 scars/site is suggest

- Age frequency distribution = index of caribou activity

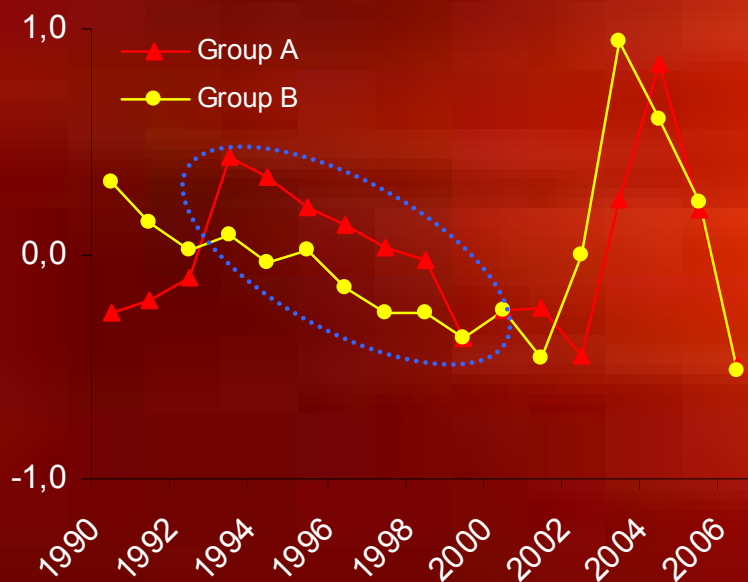

La Grande 4

Range, Census & Activity

- ✓ *Reservoir 1984-86, no direct effects*
- ✓ *Range*
 - GRH 1985
 - LRH 1999
 - activity curve = GRH demographic trend

Highest activity in group A

- ✓ *Peak of GRH*
- ✓ *Environmental factors:*
 - Fire
 - Food availability
 - Climate
 - Snow cover...

- ✓ *Variability of trajectory*

La Grande 4

Scarcity of trampling scar (south)

✓ Air vs Land Sampling

- More efficient
- Lower abundance of trail

✓ Infrastructures

- Human disturbance (HQ, Outfitters)
- Roads TT, LA1 & LA2 (maintenance)

✓ Waiting for ice cover

- use ice cover to cross
- snow or ice cover = no scar formation

Tree-ring analyse

GRH past activity

- ✓ *end XIXe: frequentation*
- ✓ *early XXe – 1950: decline*
- ✓ *1950 – 1970: growth*
- ✓ *1970 – late 1980: rapid growth*
- ✓ *1990... decrease*

- ✓ *Same trend as census*

Tree-ring analyse

LRH past activity

✓ **2 major periods of activity:**

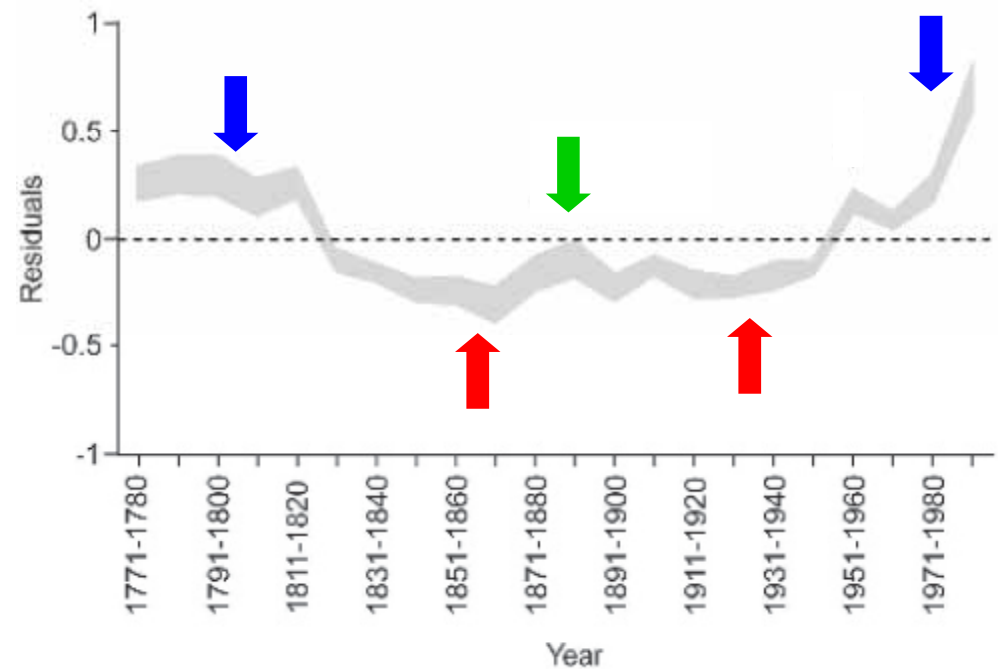

- late 1700 – early 1800
- late 1900

✓ **Low-to-moderate period:**

- late 1800 – early 1900

✓ **2 minor periods:**

- mid 1800 & 1900

✓ **Method open possibility of assessing caribou activity in time & space**
